

# JRPH/JRPL Series

**Pressure Reducing Valves** 

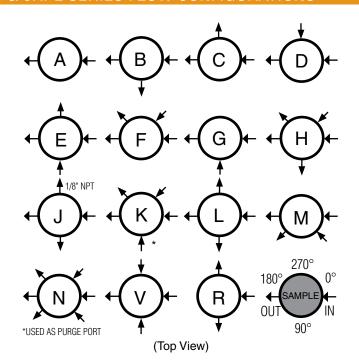

The LowFlow JRPH Series and JRPL Series are piston operated, balanced trim pressure regulators with high Cv's and KEL-F soft seat for ANSI Class VI shutoff. There are three set ranges for each model. Elastomer seals are used throughout with Buna-N, EPDM, and VIton being standard options, along with matching back up seals. These valves are designed to regulate a variety of gases, water, acids and oils.

### Features:

- All wetted materials are 316L Stainless Steel. Other materials available on application
- Soft Kel-F seat provides ANSI Class VI shutoff
- Piston sensing for better regulation at higher pressures
- Balanced trim design allows for higher flows

## OPTION & DEFINITION

**Panel Mount** The panel mount feature utilizes a threaded spring housing and a panel mount ring to secure the regulator to an instrument panel. This option requires a 2" panel cut out.

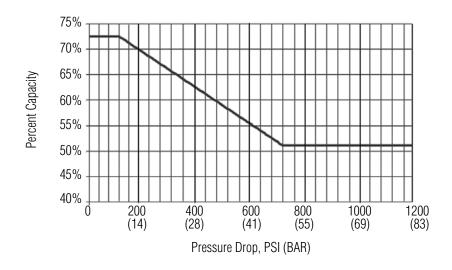

**Locking Wire** The locking wire option utilizes a lead sealed metal wire to physically hold the adjusting screw in place to prevent any unwanted set point changes.

**Tamper Proof** The tamper proof option replaces the standard adjusting knob with a stainless steel acorn nut.

**Lockout Device** The lockout device is a 2 piece polypropylene enclosure which encapsulates the adjustment knob and prevents unwanted set point changes. The part number required for this valve is 26971. (Lock not included)

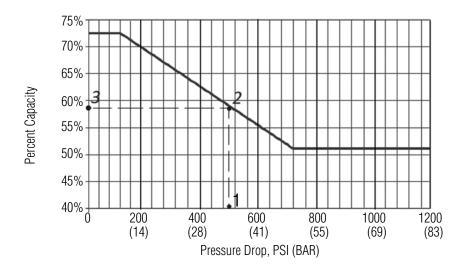

## JRPH & JRPL SERIES SIZING

#### SIZING

- 1. Find the pressure drop on the X-axis
- 2. Draw a line, parallel with the Y-axis to the point where it intersects the curve on the graph
- 3. Draw a line, parallel with the X-axis to the Y-axis. This will determine the percent capacity that will work with the pressure drop.
- 4. Check JVCV (Jordan Valve Control Sizing Program) to verify percent capacity is not exceeded
- 5. Note: From 720 psi (50 bar) pressure drop to maximum pressure drop (3000 psi / 207 bar) use 51% capacity

#### **EXAMPLE**

Methane gas, ambient temperature, PI - 1400 psi, P2=900 psi, 3/4" schedule 40 pipe, flow rate 50,000 SCFH

- 1. Pressure drop of 500 psi.
- 2. Draw a line, parallel with the Y-axis to the point where it intersects the curve on the graph
- 3. Draw a line, parallel with the X-axis to the Y-axis. This will determine the percent capacity that will work with the pressure drop. The percent capacity you can use is 58% of the rated Cv.
- 4. Input the process conditions into the JVCV sizing program. Using the conditions in this example, a 3/4" JRPL with 0 1160 range spring will be 43% open, lower than the 58% capacity based on the pressure drop.
